

Drawer Removal and Installation

BEFORE REMOVING DRAWERS

Read through the instructions to familiarize yourself with the proper steps.

We suggest that you have a clean area to place drawers once removed. Avoid stacking drawers after removal to prevent damage.

Removal and installation of drawers should be done by two people.

STEP 1 - Removal

Extend the drawer until it is in its farthest out position. Push the small black plastic clip in on the drawer glides (Refer to image). Pull the drawer gently outward till the clip disengages the glides. Pull the drawer straight outward till the drawer is free from the cabinet. Repeat this procedure for all for drawers.

STEP 2 - Installation

Fully extend the drawer glide from the cabinet. Carefully guide the drawer glide inner into the extended members, be sure the two glide sections are seated properly (see photo examples below). Keep the glide fully extended and slide the drawers into the glide until the black plastic clip fully engages into each side. When the clip is fully engaged it will lock the two portions of the glide together and prevent separation when the drawer is fully extended. Once clips are seated, gently push the drawer the rest of the way in. If the drawer does not slide in easily or you are able to pull the drawer completely out, back out and ensure the glides are seated properly. See photo.
